

TX-50 Reloading Press

The world's first auto-indexing, progressive reloading press designed to handle the rigorous loading of large capacity cartridges. Five reloading positions/stations include: sizing and depriming; priming with adjustable primer seating depth and powder drop; powder check/verification; bullet seating; and a final position for crimping or length/shape gauging.

Setup to load .50 caliber, the TX-50 includes a large capacity powder measure and a powder check system. The RCBS powder measure can drop 75 charges of 250 grains before refilling. The shell feeder is also included and feeds up to ten shell casings per minute.

The massive 7" stroke of the TX-50 handles even the longest possible OAL. Use standard 1-1/2" dies (not included) for loading other .50 cal base cartridges, or use available reducer bushings to enable the press to accept 1" or 7/8" dies. All parts are easily removed for cleaning. The press can be mounted directly onto a sturdy bench, or use the optional TX-50 stand to increase the height. (Not all items pictured are included.)

Exceptional quality, aerospace tolerances, and numerous design innovations ensure consistent and accurate loadings. The TX-50 is machined from the highest grade metal billets to ensure years of flawless precision loading without corrosion. **Lifetime warranty.**
